

**Amendments to and Listing of the Claims:**

1. (Currently amended) An LED lamp comprising  
at least one LED chip having an emission peak wavelength of 400 nm to 490 nm,  
and  
a wavelength converting portion including a phosphor for transforming the  
emission of the LED chip into light having a longer wavelength than that of the emission,  
wherein the LED lamp further includes filtering means, of which the spectral  
transmittance is adjusted so as to minimize color shifting even if the amount of current supplied  
to the LED chip to make the LED chip produce the emission has changed and wherein the  
spectral transmittance of the filtering means corresponds to a wavelength dependence of an  
inverse change rate.
2. Canceled.
3. (Currently amended) The LED lamp of claim 2, 1 wherein the spectral  
transmittance of the filtering means is relatively low in a wavelength subrange in which the  
inverse change rate is less than 100%.
4. (Original) The LED lamp of claim 1, wherein the filtering means is designed such  
that the spectral transmittance thereof becomes lower in at least a portion of the wavelength  
range of 400 nm to 545 nm than in the remaining visible radiation range.
5. (Original) The LED lamp of claim 4, wherein the filtering means is designed such  
that the spectral transmittance thereof becomes lower in at least a portion of a wavelength range,  
which is shorter than the emission peak wavelength of the LED chip, than in the remaining  
visible radiation range.
6. (Original) The LED lamp of claim 1, wherein in the wavelength range of 400 nm  
to 545 nm, the filtering means has a filtering ratio of 3% to 35%.

7. (Original) The LED lamp of claim 1, wherein the LED chip is mounted on a substrate.
8. (Original) The LED lamp of claim 7, wherein the LED chip is flip-chip bonded to the substrate.
9. (Original) The LED lamp of claim 1, wherein the wavelength converting portion is made of a resin.
10. (Original) The LED lamp of claim 9, wherein the wavelength converting portion has a cylindrical shape and covers the LED chip entirely.
11. (Currently amended) The LED lamp of claim ~~7~~ 9, wherein the wavelength converting portion is ~~further~~ covered with another resin.
12. (Original) The LED lamp of claim 1, wherein the filtering means is arranged so as to cover the wavelength converting portion.
13. (Original) The LED lamp of claim 1, wherein the filtering means is made of a resin.
14. (Original) The LED lamp of claim 1, wherein the wavelength converting portion and the filtering means are both made of the same resin and substantially no interface is present between the wavelength converting portion and the filtering means.
15. (Original) The LED lamp of claim 1, wherein the LED lamp has a card shape so as to be attachable to, or removable from, an illumination unit including a lighting circuit.
